CAUTION - HOT

A chef in a white uniform and a man in a dark suit and tie stand in a kitchen with stainless steel lockers. Both are holding and looking at a light blue napkin. A black text box is overlaid on the chef's chest.

“Yo, they’re goddamn forks!”

A chef in a white uniform is peeling a mushroom with a paring knife. A woman in a black shirt and apron is standing next to him, also holding a mushroom. The scene is set in a kitchen with white subway tiles and shelves in the background. A black text box is overlaid on the chef's chest.

“What are you making?”

“I’m just peeling mushrooms for the Lamb des Tournelles.”

A chef in a white uniform and a woman in a black shirt and apron are in a kitchen, both focused on peeling mushrooms. The chef is on the left, and the woman is on the right. They are standing in front of a white tiled wall with a shelf holding various kitchen items. A black text box is overlaid on the chef's chest.

“Peeling mushrooms?”

“It’s just a nice little, fun detail, so when the diners see it, they know that someone spent a little time on their dish.”

What are the “peeled mushrooms” signals in urgent care?

# Financial Disclosures

---

Medraki (Booth 726)

# Learning Objectives

---

- Describe the historical evolution of clinical quality measurement and its limitations when applied to urgent care settings.
- Evaluate existing frameworks for measuring urgent care quality and identify the gaps each framework leaves unaddressed.
- Apply insights from ~~3000~~ 16,000 chart review data to identify patterned clinical quality failures and opportunities for improvement in urgent care practice.

# A Brief History of Clinical Quality Assessment

Ernest Codman, 1910s

Avedis Donabedian, 1966

IOM's Crossing the Quality Chasm, 2001

Value-Based Care, 2010s–Present

# Frameworks (Mostly Borrowed) for UC Quality

| Framework          | What It Measures       | What It Misses                   |
|--------------------|------------------------|----------------------------------|
| MIPS               | Antibiotic stewardship | Clinical reasoning               |
| UCA Accreditation  | Organizational systems | Individual clinician performance |
| Press Ganey or NPS | Patient experience     | Clinical appropriateness         |
| Return Visit Rates | Downstream outcomes    | Why the outcome occurred         |
| Chart Reviews      | Process and reasoning  | Outcome linkage                  |

# Describe your current practice setting.

---

- A. Solo owner-operated clinic
- B. Multi-site practice (<10 sites)
- C. Multi-site practice (10+ sites)
- D. Multi-site practice across different states
- E. Multiple service lines (e.g. primary care and workplace health)
- F. Other

# How does your practice currently measure clinical quality?

---

- A. Patient experience (e.g. NPS and Google Reviews)
- B. Incident reporting (e.g. Jira, medical malpractice, etc.)
- C. Externally defined metrics (e.g. MIPS)
- D. Chart reviews
- E. None of the above
- F. Other

# Who in your practice currently performs chart reviews?

---

- A. Supervising physicians
- B. Medical directors
- C. Peer-to-peer
- D. Me
- E. Other

# Which charts are reviewed?

---

- A. All charts
- B. Random percentage of charts
- C. Self-selected by the rendering clinician to send to the reviewer
- D. Pre-defined criteria (e.g. chief complaint, age, procedures)
- E. Cases flagged through incident reporting (e.g. complaints)
- F. Clinicians being remediated or onboarded
- G. Other

# How are the charts reviewed and feedback given?

---

- A. Informally (i.e. reviewers follow their own systems)
- B. EHR inbox
- C. Google Form
- D. Email
- E. Third-party software
- F. Monthly or quarterly meetings
- G. Other

# Do you track whether feedback changes behavior?

---

A. Yes

B. No

You can tell the quality of the carpenter by looking at the back of the drawers.

N/A

Was the management plan justified in the MDM (e.g. CXR not ordered due to...)?

Were abnormal vitals addressed and repeated?

Were high risk conditions specifically considered and discussed in the MDM?

Was there a clear plan for follow up?

Feedback for Case #1

Your answer

# A biopsy of urgent care quality...

---

16,236 individual case reviews across 678 clinicians by 155 reviewers

- Was the management plan justified in the MDM (e.g. CXR not ordered due to...)?
- Were abnormal vitals addressed and repeated?
- Were high risk conditions specifically considered and discussed in the MDM?
- Was there a clear plan for follow up?
- Free text feedback

# A biopsy of urgent care quality...

---

| Domain                    | Pass Rate |
|---------------------------|-----------|
| MDM Justified             | 96.6%     |
| Follow-Up Plan            | 97.2%     |
| High-Risk Considered      | 93.6%     |
| Abnormal Vitals Addressed | 72.4%     |

# A biopsy of urgent care quality...

---

| Domain                    | Pass Rate |
|---------------------------|-----------|
| MDM Justified             | 96.6%     |
| Follow-Up Plan            | 97.2%     |
| High-Risk Considered      | 93.6%     |
| Abnormal Vitals Addressed | 72.4%     |

## Insight #1: Abnormal Vitals Are the Single Biggest Clinical Gap

- When a patient has an abnormal vital sign, clinicians fail to address and repeat it 27.6% of the time.
- Examples:
  - Elevated BP with no repeat
  - Tachycardia in a patient with a recent DVT
  - Borderline vitals in elderly patients

A clinician who addresses the abnormal vital sign, documents a reason or repeats it – that's someone who took the time.

Insight #2: Documentation and Diagnostic Reasoning Are the Dominant Feedback Themes

# Theme #1: Justification Gaps

---

"Rx for antibiotic given but documentation did NOT justify the Rx."

"Why not I&D this? Would justify that in the MDM, since you called this an abscess."

"I don't have any understanding of why you sent this patient to the ED for vertigo. I also don't have a clue why you ordered a UA."

"Need to make a stronger justification for antibiotic use at 4 days of URI symptoms."

## Theme #2: Internal Contradictions

---

"Antibiotics were prescribed, but MDM discusses waiting for CXR results."

"Remember: just because a patient says they have recurrent UTIs does not mean they actually are UTIs unless culture confirmed. At this visit, her urine culture was actually negative."

"Exam documentation explicitly states 'there is no sign of bacterial infection' yet the patient was treated with antibiotics."

"It was documented that the patient had RLQ pain but stated no signs of appendicitis — this is very contradictory. Patient should have been sent to ED."

# Theme #3: Physical Exam Complaint/Exam Mismatch

---

"OP exam not noted, when chief complaint was sore throat. Not obvious why asthma implicated in acute sore throat as potential etiology."

"For an ear lavage, physical exam should demonstrate there is a cerumen impaction. There should also be a repeat exam to assess that the TM is intact."

"A focused examination of the injured body part should be done at every worker's comp visit. Right hand exam missing."

"Did you really do a HEENT exam as thorough as documented?"

# Theme #3: Physical Exam Complaint/Exam Mismatch

---

"Missing visual acuity exam — this is considered the vital sign of the eye. Very important to evaluate severity of eye injuries."

"Unclear why urgent ortho referral was made — knee exam not complete (e.g., presence of effusion?)"

"Given viral symptoms and fever, would add Kernig and Brudzinski test and specific mention of no meningismus, photophobia, phonophobia."

**URGENT CARE**

49yo M presenting with “General Urgent Care”

**URGENT CARE**

A middle-aged man with short, graying hair is shown from the chest up. He is wearing a blue polo shirt and has his hands clasped together in front of his chin, looking directly at the camera with a serious, thoughtful expression. The background is a plain, light-colored wall.

“Chest pain, fatigue, phlegm production, fever, chills, no appetite”

“Symptoms are localized to the chest, specifically the sternum”

2 days

No sick contacts

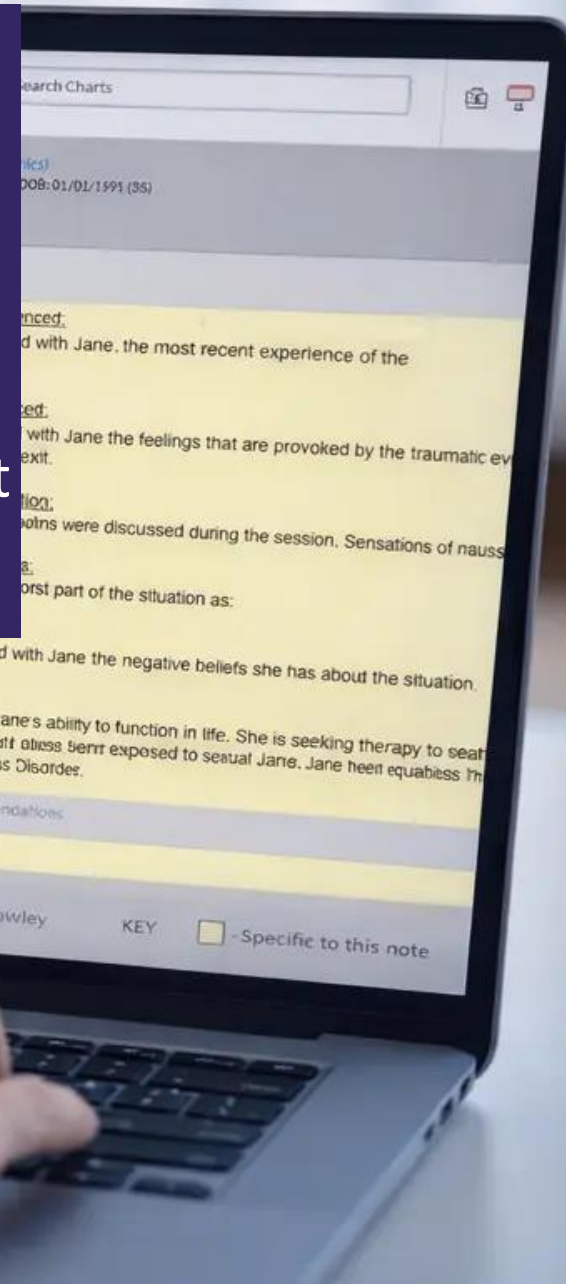

BP 151/118

“Cardiovascular examination revealed normal heart sounds with no murmurs, gallops, or rubs. Pulmonary auscultation was clear without crackles or wheezes.

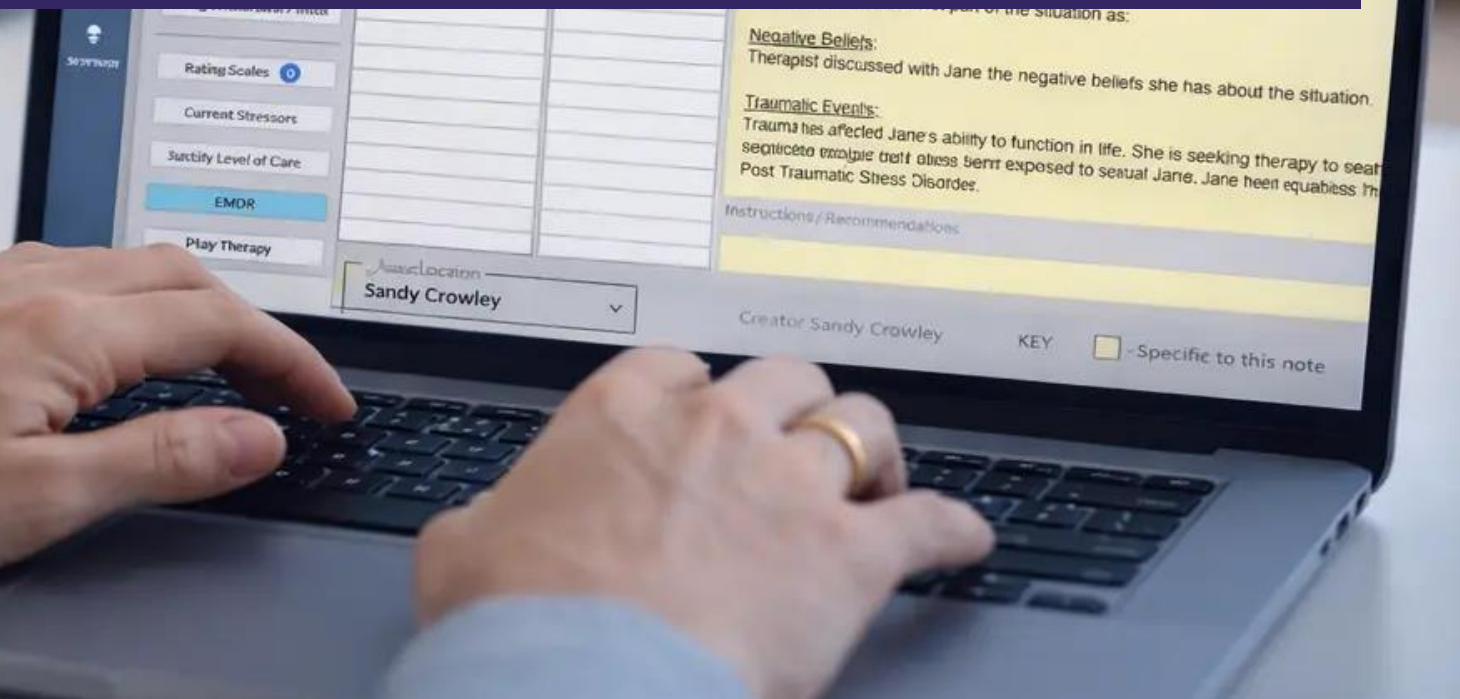

CXR WNL

Flu / RSV / COVID Negative

“Patient’s presentation today supports the diagnosis of a viral upper respiratory infection, given the symptoms of chest pain, fatigue, phlegm production, fever, chills, and loss of appetite, as well as clear lung auscultation and absence of bacterial infection signs in the ears and throat. Other diagnoses such as COVID-19, influenza, RSV, and bacterial pneumonia are considered but cannot be confirmed without further testing.”

“- Prescribe Promethazine DM for nighttime cough suppression and drowsiness.  
- Prescribe Benzonatate pills as a non-drowsy cough suppressant.  
- Advise patient to rest until test results are received.  
- Shared decision making with the patient regarding the need for chest X-ray.  
- Return to clinic and emergency department precautions reviewed with the patient, who has verbalized understanding.”

1. Acute cough
2. Essential (primary) hypertension
3. Atypical chest pain

**When Last Experienced:**  
Therapist discussed with Jane, the most recent experience of the experience.

**Feelings Experienced:**  
Therapist discussed with Jane the feelings that are provoked by the traumatic event trapped with no way to exit.

**Worst Part of Situation:**  
Jane describes sensations were discussed during the session. Sensations of nausea.

**Negative Sensations:**  
Jane describes the worst part of the situation as:

**Negative Beliefs:**  
Therapist discussed with Jane the negative beliefs she has about the situation.

**Traumatic Events:**  
Trauma has affected Jane's ability to function in life. She is seeking therapy to seek self-help and stress management. Jane has been exposed to sexual abuse and Post Traumatic Stress Disorder.

Instructions / Recommendations

Creator: Sandy Crowley

KEY:  - Specific to this note

1 week later...

“Patient called; states pain in chest is improving, having intermittent decreased exercise intolerance and trouble sleeping. Advised patient to go to ER if he had severe chest pain, swelling, or persisting pain. Advised patient if he had persistent mild symptoms to go to PCP assigned by HMO.”

1 month later...

Patient was admitted to the ICU with CHF exacerbation. Patient subsequently suffered from a second cardiac event and expired.

Insight #3: Great Saves Are Hiding

1,305 feedback entries contain positive language.

# Great Saves

---

"Chief complaint: cold and flu symptoms x2 days. VS: HR 105, Temp 102.7, O2 90%, noted mild respiratory distress and conversational dyspnea. Dx: possible sepsis — discussed ambulance and EMS declined. Good job charting this. Really good chart — good catch."

"Great job. You picked up on: 1) LOC, 2) C-spine tenderness, and 3) abdominal tenderness — all red flag symptoms post-MVA. Good exam and appropriate ER referral."

"6-year-old female, chief complaint eye swelling. Dx: possible orbital cellulitis. ER transfer with ER referral form. Good catch."

# The Ceiling of Manual Chart Review

| Gap                                   | What We Can't Answer                                 |
|---------------------------------------|--|
| No diagnosis / chief complaint        | Where do failure cluster?                            |
| 49% of cases have no written feedback | Did the clinician learn anything from this review?   |
| No reviewer calibration               | Does "Yes" mean the same thing across 155 reviewers? |
| No longitudinal tracking              | Does feedback actually change behavior over time?    |
| 5 charts / clinician / month sampled  | Is that representative of anything?                  |

What are the “peeled mushrooms” signals in urgent care?

# What We're Building Together: UCA Quality Metrics 2025–2026

| Measure (Draft)                            | Why It Matters                                    |
|--|---|
| EKG for chest pain (age > 12)              | Missed ACS is UC's highest-stakes miss            |
| CT for anticoagulated head trauma          | High-stakes miss                                  |
| Epinephrine for anaphylaxis                | Binary, high-stakes, no acceptable exceptions     |
| No antibiotics for bronchitis              | Most common stewardship failure                   |
| Correct antibiotic for bacterial sinusitis | First-line adherence is measurable and improvable |

# What We're Building Together: UCA Quality Metrics 2025–2026

## Measure (Draft)

EKG for chest pain (age > 12)

CT for anticoagulated head trauma

Epinephrine for anaphylaxis

No antibiotics for bronchitis

Correct antibiotic for bacterial sinusitis

These are five measures for a setting that sees 160 million visits a year. This is just the beginning!

# Key Takeaways

---

- The quality frameworks we've inherited — MIPS, satisfaction scores, return visit rates — were built for other settings and reveal only part of the quality picture. MIPS knows if you tested for strep. It has no idea if you considered PE in the tachycardic 40-year-old who just returned from Bali.
- Quality failures in urgent care are patterned, not random: unaddressed vital signs, incomplete or inconsistent exams, decisions lacking documented rationale. They're teachable and fixable.
- Chart review is not an audit. It's how our craft improves. Make your chart review process educational, not punitive. Celebrate the great saves alongside the gaps. The clinician who recognized sepsis in a patient presenting with cold and flu symptoms deserves to be recognized.
- The standards for urgent care quality are ours to define. The people best positioned to define them are in this room. Get involved with the UCA Quality Committee.

Thank you!
